

AI usage log template

Student : Samuel Charchar

SID : 40261319

Task ID: SCRUM-5: design and create frontend.

Tools used: Chat gpt-3.5

Purpose of AI Use: The purpose of the AI use was to help brainstorm potential technologies that could be used for our frontend as well as setup a basic architecture for the front-end.

Prompt: can you help me decide what technologies/languages we can use for our careerconnect* project? My team and I are mostly familiar with react, but our open to more ideas so help me brainstorm. At the same time, without writing any actual code help me decide on the architecture and setup the foundation, for example what files/ classes I might need to create.

Response:

Recommended CareerConnect stack

- **Frontend:** React + TypeScript + Vite
- **Backend:** Node.js + Express + TypeScript
- **Database:** PostgreSQL
- **Database tool:** Prisma
- **API:** REST
- **Authentication:** JWT + password hashing
- **AI:** External AI API through the backend

Architecture

```
graph TD
    A[React Frontend] --> B[REST API]
    B --> C[Express Backend]
    C --> D[PostgreSQL]
```

Keep it as a **modular monolith**, not microservices.

Basic project structure

```
CareerConnect/
├─ client/      ← React
├─ server/      ← Express backend
├─ docs/        ← architecture/design
├─ AI_Log/      ← required by course
└─ README.md
```

So the big idea is simply:

React → Express → PostgreSQL, with your AI service connected through Express.

That is a solid foundation for the requirements in your assignment, including authentication, resumes, jobs, applications, notifications, and the required AI feature.

AI-Suggested Content: The AI suggest some technologies that are popular for web development, as well as the basic architecture for the frontend.

Validation: Compared with some other sources and did my independent research.

Decision: The decision was partially accepted. We decided to use React and Vite, but we took consideration of the team's personal experience with certain languages/technologies. The basic architecture was also partially accepted.

Reflection: I learnt how to structure a full stack web app, choose the correct technologies and how to design/ structure the architecture.
