

AI Usage Log Template

Student: Hind Houfaidi

SID: 40125306

Task ID: SCRUM-18: Update .gitignore

Purpose of AI Use: To identify files and folders that should not be committed to the repository.

Prompt: For a web application using React, Vite, Node.js, Express, and MongoDB, what files and folders should normally be added to the .gitignore?

Response: AI suggested excluding dependencies, environment files, system files, logs, test coverage, and IDE/editor files.

AI-Suggested Content: Suggested entries such as node_modules, .env, .DS_Store, log files, coverage files, and IDE folders.

Validation: Reviewed the suggested entries and verified that important project files were not excluded.

Decision: Partially accepted and modified before use.

Reflection: AI helped identify common files that should not be committed to the repository.

Responsible Person: Hind Houfaidi

Task ID: SCRUM-20: Implement User Registration and Authentication

Purpose of AI Use: To understand the main requirements for secure registration and login.

Prompt: For a web application using Node.js, Express, MongoDB, and Mongoose, what should be considered when implementing secure user registration and login?

Response: AI suggested password hashing, authentication tokens, input validation, duplicate-email checking, database integration, and secure environment variables.

AI-Suggested Content: Use bcryptjs for password hashing, JWT for authentication, input validation, MongoDB/Mongoose for user storage, and environment variables for sensitive information.

Validation: Reviewed the suggestions and manually tested the implemented functionality.

Decision: Partially accepted and modified before use.

Reflection: AI helped clarify the main authentication and security requirements.

Responsible Person: Hind Houfaidi

Task ID: SCRUM-20: Authentication Testing

Purpose of AI Use: To identify useful test cases for registration and login.

Prompt: What manual test cases should be performed for a registration and login system using JWT authentication and MongoDB?

Response: AI suggested testing successful registration and login, duplicate emails, incorrect passwords, unknown users, missing required fields, and missing environment configuration.

AI-Suggested Content: A combination of successful and error test cases for the authentication functionality.

Validation: Executed the suggested tests manually and verified the server responses for each case.

Decision: Accepted.

Reflection: AI helped organize the testing process and identify important positive and negative test cases.

Responsible Person: Hind Houfaidi
