AI usage log — SCRUM-45

Student: Thanh Samdara Thach

SID: 40310332

Task ID: SCRUM-45 — User Profile and Resume Management

Tool used: AI coding agent

Purpose of AI Use: To help create automated tests for code added to the user profile and resume management branch, and to review whether the implemented profile requirements were respected.

Chat link: No chat link available (screenshots provided).

Discussion 1 — Creating unit and integration tests

Prompt 1: "Create test folder, create test class, create tests for newly added code and add them there."

AI response: The agent initially added a Jest integration suite for profile-picture functionality. It reported coverage for authenticated access, upload, replacement, retrieval, validation, deletion, and the hasProfilePicture flag. It reported 17 passing tests across two integration suites.

Prompt 2: "does that include unit tests and integration tests?"

AI response: It clarified that it had added integration tests only, not unit tests.

Prompt 3: "can you do it, for all code added in this branch"

AI response: It reported adding client unit tests for API helpers and profile/resume components, server unit tests for the user schema and profile-picture queries, and server integration tests for profile-picture routes. Its validation summary reported 25 client unit tests, 8 server unit tests, and 17 server integration tests passing, along with a successful client build. Lint returned no errors but existing warnings.

Discussion 2 — Checking acceptance criteria

Prompt: I asked whether these three requirements were respected: users can save profile changes; profile information remains available after logging out and back in; and users can edit only their own profile and resume. I ended with "WAS THIS RESPECTED?"

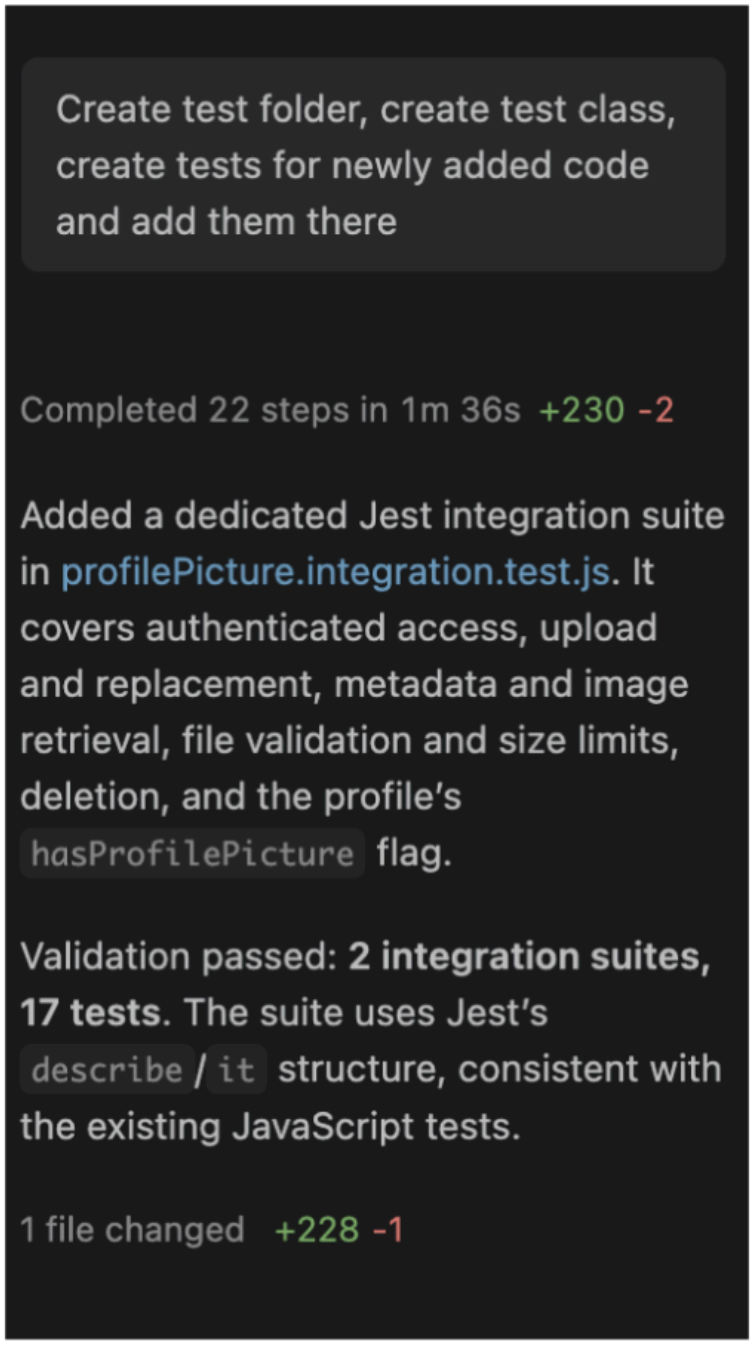

AI response: The agent said the implementation appeared to respect all three. It pointed to the authenticated profile update route, database persistence, and use of the authenticated user ID for profile and resume operations. However, it warned that the tagged navigation test did not verify saving, persistence, or ownership, and that integration tests bypassed real authentication middleware. Therefore JWT-based ownership enforcement was not proven end to end by those tests.

My contribution and limits

I asked the agent to generate tests, followed up to make sure both unit and integration tests were covered, and then checked the feature against the acceptance criteria. The second discussion identified missing verification rather than confirming that additional end-to-end tests had been added. The numbers and results above are the AI agent's reported results from the screenshots.

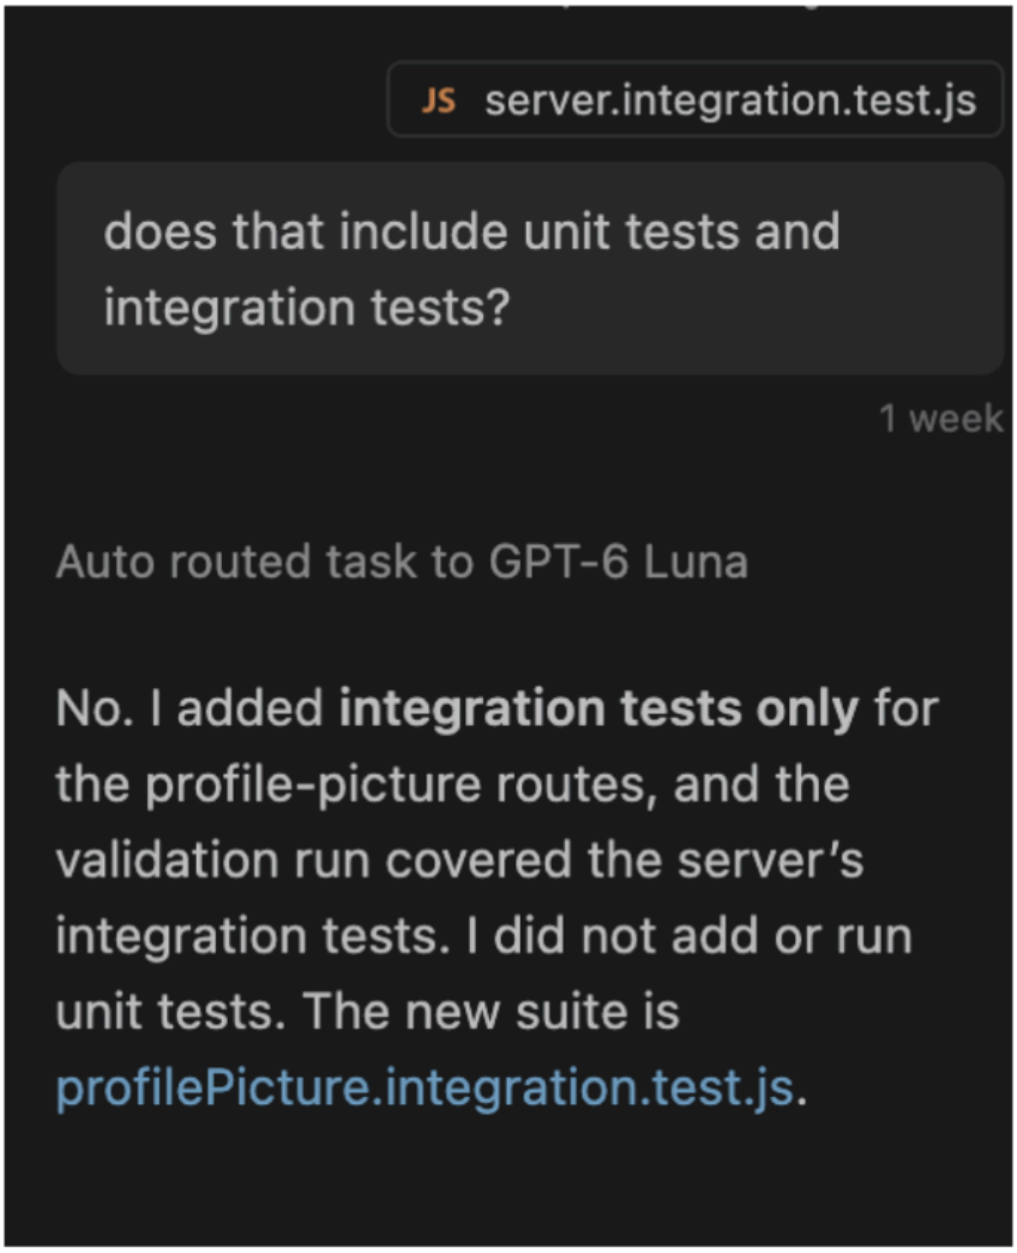

Discussion 1 — Screenshot 1

Initial request and the AI response describing the new integration tests.

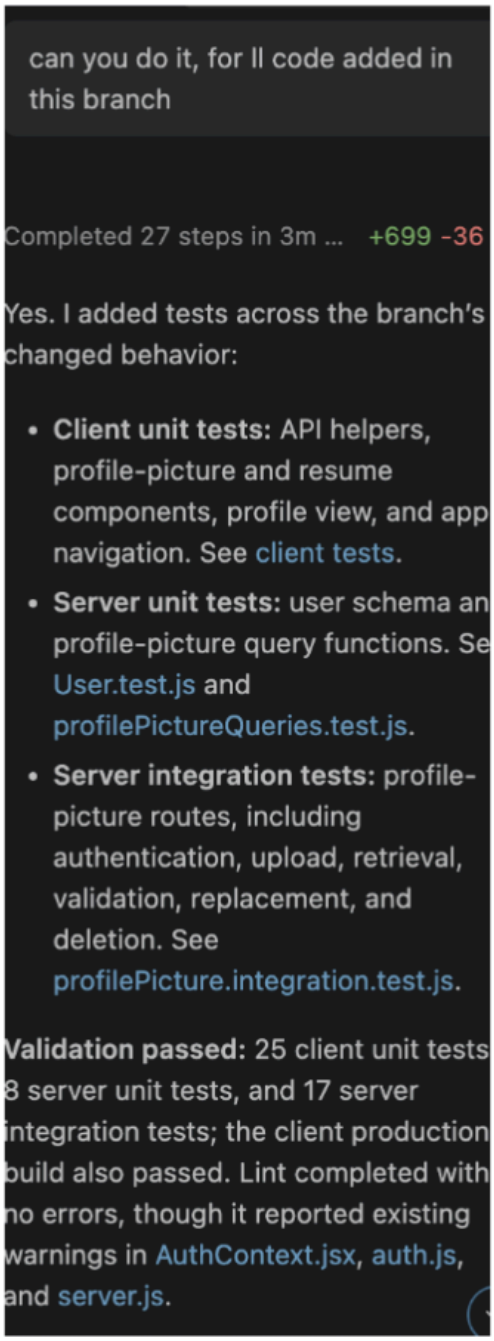

Discussion 1 — Screenshot 2

Follow-up confirming that unit tests were not originally included.

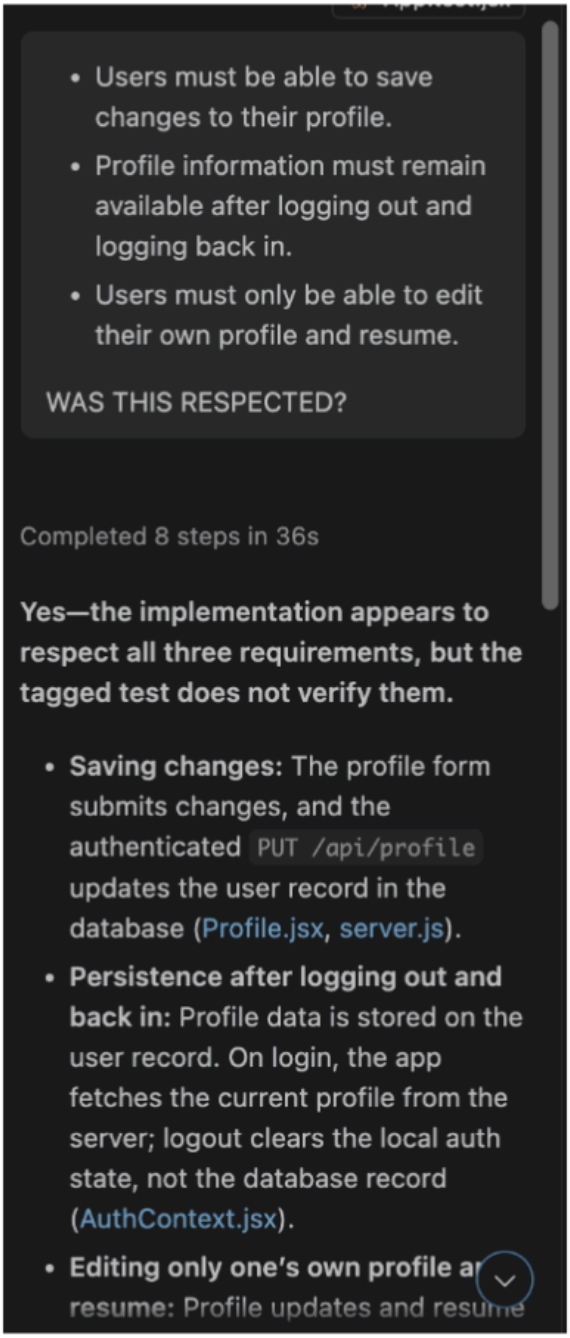

Discussion 1 — Screenshot 3

Expanded request for tests across the branch and the reported validation results.

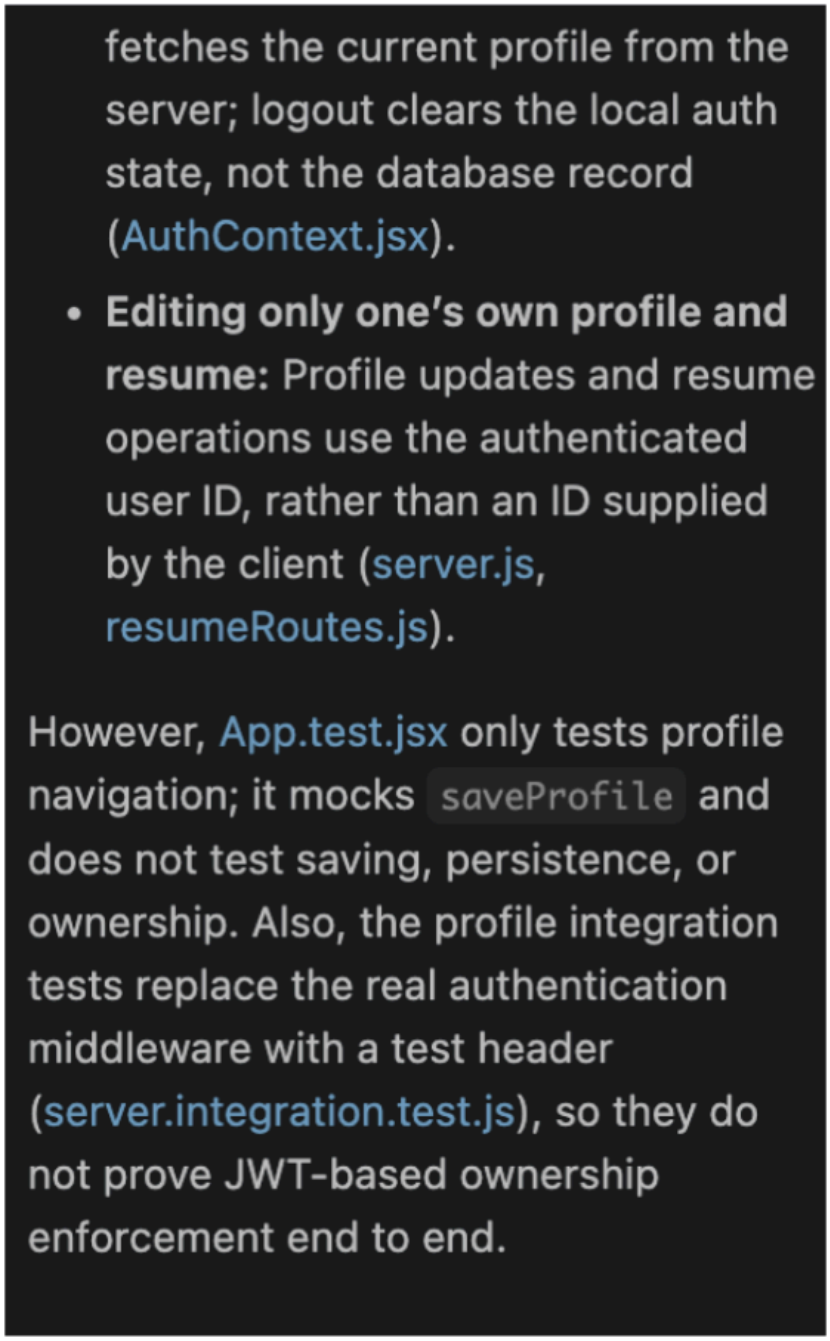

Discussion 2 — Screenshot 1

Question about saving, persistence, and restricting profile/resume edits to the owner.

Discussion 2 — Screenshot 2

Continuation of the AI answer, including gaps in automated verification.

fetches the current profile from the server; logout clears the local auth state, not the database record (AuthContext.jsx).

- **Editing only one's own profile and resume:** Profile updates and resume operations use the authenticated user ID, rather than an ID supplied by the client (server.js, resumeRoutes.js).

However, App.test.jsx only tests profile navigation; it mocks `saveProfile` and does not test saving, persistence, or ownership. Also, the profile integration tests replace the real authentication middleware with a test header (server.integration.test.js), so they do not prove JWT-based ownership enforcement end to end.

No AI Usage — SCRUM-146

Student: Thanh Samdara Thach

SID: 40310332

Task ID: SCRUM-146 — Recruiter Dashboard and Posting Management

Tool used: None

Purpose of AI Use: Not applicable

Chat link: Not applicable

Explanation

No AI was used for SCRUM-146 because I had run out of AI credits. Instead, I used one of my previous projects as a starting point and worked on adapting it for the Recruiter Dashboard and Posting Management feature.

Since I did not use an AI tool for this task, there are no AI prompts, responses, or screenshots to include.
