Student: Thanh Samdara Thach

SID: 40310332

Task ID: SCRUM-23: Implement a resume upload functionality

Tool used: GitHub Copilot (agent mode, Claude Sonnet 5) in VS Code

Purpose of AI Use: The purpose of its used it to have a base implementation of a resume upload functionality.

Chat link: No chat link available

Prompt: “Implement a resume upload functionality without coding the whole feature. Only give the base code, and the rest will be done by me. The frontend and database have already been coded; leave comments so that I will be able to connect my functions with them.”

Response: I was unable to provide a link since I was using an agent in VS Code. But I asked it to give me a resume.

Summary

Backend

- `Resume.js`: schema linking a resume (binary `data`, `contentType`, `originalName`, `size`) to a `User` via a unique `user` field (one resume per user).
- `resumeRoutes.js`: REST endpoints under `/api/resumes/:userId`
 - `GET /:userId` — metadata, `GET /:userId/file` — view/download (`?download=1`)
 - `POST /:userId` — initial upload (409 if one exists)
 - `PUT /:userId` — replace
 - `DELETE /:userId` — delete
 - Uses `multer` (memory storage) with a 5MB limit and PDF/DOC/DOCX-only `fileFilter`; validates `userId` as a Mongo ObjectId; sanitizes filenames for headers.

Important caveat (per your note that auth is coming from another branch): there's no login system yet, so routes currently trust a `:userId` route param, and the frontend has a temporary "User ID" input (stored in `localStorage`) instead of a real session. This is clearly marked with `TODO/NOTE` comments in `resumeRoutes.js` and `ResumeManager.jsx` — once the auth branch merges, swap `req.params.userId` for the authenticated `req.user.id`, drop `userId` from the routes, and remove the manual id input from the frontend.

It was able to generate base functions for upload, replace and delete. But the rest was done by me. I connected the functions to the database (MongoDB) and updated the frontend since it was missing a “page” for this newly added feature.

Since we were working in branches, the authentication (SCRUM-20) was still in progress when the story for the resume upload was in progress. The agent notified me of it, even though I already knew it. Once SCRUM-20 was done, I was able to connect the resume upload to its user.
